

# Why 3-D Mammograms?

3-D mammography is an FDA-approved advanced technology that takes multiple images, or X-rays, of breast tissue to recreate a 3-dimensional picture of the breast. It's different from traditional mammography in that traditional mammography obtains just a single image.

These multiple images of breast tissue slices give doctors a clearer image of breast masses. It makes for less false positives, less callbacks, & more accuracy. The scan makes it easier to detect breast cancer.

**Increased peace  
of mind**

**Better detection**
